Automatic linking at the One Chart conversion: run Rule B

Run Rule B (first name, last name, birth date, sex and street address the same) at the 5 April conversion. It joins 35,566 pairs of records and, by our estimate, 3 of them are two different patients: 0.17 per 2,000 links, inside the policy's one. Its 5 blood-group mismatches do not count against it as they stand: 3 sit on Calder Bay records that already hold two patients, which we split before the conversion, and 2 are left as false merges, with the twins a single registration visit shows.

Rule A, the same without the address, joins 64,484 pairs, and about 60 would merge two different patients (1.85 per 2,000). Port Calder's names cluster by community and birth year, and many of the men who came to work the boats and the yards carry the 1 January birth dates their documents gave them; 34 per cent of Rule A's chance merges are among men born since 1975. The engine's national rates put Rule A at 0.14, and the blood bank cannot see these merges: its patients are mostly over 55.

Rule C, which accepts near-identical first names at a shared address or phone, joins 50,411 pairs and would merge about 41 pairs of twins (1.63 per 2,000). The delivery log and our registration times show only 16 of them: most twins here were registered on different visits or born before their families moved to Port Calder. Rule D, on SSN and birth date, joins 42,835 pairs and would merge about 104 (4.86 per 2,000), mostly twins registered at Rosario under a parent's SSN before June 2021.

Before the conversion, HIM splits 556 Calder Bay records that already hold two or more patients, merged by its registration system since March 2019; 124 of Rule B's links touch 119 of them. The converted index will hold about 212,402 distinct patients, 69,318 of them known to both groups, and 44,567 will still sit under more than one record once Rule B runs, for the review worklist.

Detail, by rule and by community, in the evaluation workbook.

False merges are counted as HIM-14 section 3 counts them, for each pair of records a rule would join, on the 2 November 2026 extracts the conversion plan takes as its baseline.
